Picking the right song shouldn't take longer than actually listening to it. So I built TuneCafe for myself: a desktop music player styled like a miniature iPod, where I just pick a drink and my playlist starts playing instantly. No browsing, no searching, no decisions. Each drink maps to a mood and a playlist I already love, so every song that plays is one I'd actually listen to. It's part personal tool, part aesthetic object, something that sits on my screen and makes my setup feel a little more like my own.

When I read, I often get flooded with thoughts (theories, reactions, iconic lines) but I know I'll forget them later. That's the problem **ReadingLog** was built to solve. As part of my university group project, I designed pages in Figma (My Library, Reading Details, and Profile page) and implemented them into Flutter code, where the app lets users capture thoughts through journal entries and saved quotes, organize books into custom shelves, track reading progress, and stay focused with a built-in Pomodoro timer, all without manual input, since book data comes straight from the Google Books API.

t=zy001NGhoqRJytNa-1

Staying productive is hard and distractions are everywhere. The Pomodoro Technique is one of the most well-known ways to fight that, so for my university Software Architecture project, where we had to apply real software patterns and architecture in React and TypeScript, our team built **PomodoroQuest**, a web app that helps users improve focus, manage study or work sessions, and maintain a healthy balance between productivity and rest. I worked on the timer frontend, from building the core countdown logic and handling mode switching between focus and break sessions, to wiring up the EXP bar animation that rewards users after each completed session and I also designed the Bluey and Bingo theme.

HONKAI STAR RETAIL

Honkai Star Retail is a mobile application for browsing and purchasing Honkai: Star Rail-themed items, including Galactic Resources and Light Cones, developed as a project for my university's Mobile Hybrid Solution course based on a given case study/theme (Galactic Resources and Light Cones e-commerce). The app supports two roles: Users, who can browse the item catalog, search for specific items, view detailed information (name, type, description, stock, image, and price), and purchase multiple items in a single transaction based on available stock; and Admins, who manage the entire catalog through full CRUD functionality : adding new items, updating item details, adjusting stock levels, and removing items. The app also includes a Light/Dark mode toggle, letting users customize the interface to their preference.

RE-FASHION

Project Title

Re-Fashion

Year Accomplished

2025

Tech Stack

Python

OpenAI GPT API

Publication Link

<https://github.com/Shal1964/ReFashion>

Re-Fashion is a sustainability analysis tool for the fashion industry, built as a semester 3 university project with a focus on functional depth and data-driven logic over visual design. It uses a hybrid ML + LLM architecture: a Gradient Boosting Regression model calculates an Eco Score from structured sustainability indicators such as carbon emissions, water usage, and labor metrics, while an LLM serves as the interface, letting users describe a product or brand in natural language, extracting the relevant parameters, and turning the numerical results into clear explanations and recommendations. The model is currently trained on a synthetic dataset modeled on realistic industry ranges, as brand-level sustainability data is fragmented and rarely public. The pipeline is designed to be retrained on real data without architectural changes. The app includes an Eco Score Calculator, a Product Sustainability Advisor with material recommendations, a Fast Fashion Impact Awareness section, a Conscious Shopping Assistant, and a chatbot for follow-up questions.

BEYOND THE CODE

Volunteer & Organizations

Volunteer & Organizations

Role:

Volunteer, Committee,
Activist, Vice Coordinator

I've always believed that learning doesn't only happen inside a classroom. Since high school, I've learned the importance of being active outside of class, starting with joining committees and helping run school events, then joining Youth in Mission, traveling as far as Singkawang and Rote Island to volunteer in local schools, churches, and orphanages. Those trips took me far outside my comfort zone and taught me how to connect with people whose lives looked completely different from mine. Carrying that same spirit into university, I joined KBMK Binus, where I grew from being a student activist in the Design and Social Media division to becoming Vice Coordinator, serving a community that extends beyond campus through temple visits, orphanage outreach, and seminars.
